1 Rotation Matrices

1.1 Check if R is a rotation matrix

To check if R is a rotation matrix we have to check:

- $\det(R) = 1$
- Orthogonality: $R^T R = I$
- Normality: for each column R_i of R, $\|R_i\| = 1$

1.2 Rotation direct problem

To find R from θ and \mathbf{r} we use the Rodrigues' rotation formula:

$$R(\theta, r) = rr^T + (I - rr^T) \cos(\theta) + (S(r)) \sin(\theta) \quad (1)$$

where $S(r)$ is the skew-symmetric matrix of \mathbf{r} :

$$S(r) = \begin{bmatrix} 0 & -r_3 & r_2 \\ r_3 & 0 & -r_1 \\ -r_2 & r_1 & 0 \end{bmatrix} \quad (2)$$

1.3 Rotation inverse problem

To find θ and \mathbf{r} from R we first check if there is a singularity:

$$\sin(\theta) = \frac{1}{2} \left(\sqrt{(R_{32} - R_{23})^2 + (R_{13} - R_{31})^2 + (R_{21} - R_{12})^2} \right) \quad (3)$$

1.3.1 singularity (hence $\sin(\theta) = 0$)

If it is a singularity we can find \mathbf{r} and θ : if θ is 0: there is no solution for \mathbf{r} .
if θ is $\pm\pi$:

we set $\sin(\theta) = 0$, $\cos(\theta) = -1$ and we find \mathbf{r} :

$$\mathbf{r} = \frac{1}{2} \begin{bmatrix} \pm\sqrt{R_{11} + 1} \\ \pm\sqrt{R_{22} + 1} \\ \pm\sqrt{R_{33} + 1} \end{bmatrix} \quad (4)$$

To decide the signs of the elements of \mathbf{r} we can use the following criteria:

- $r_x r_y = R_{12}/2$
- $r_x r_z = R_{13}/2$
- $r_y r_z = R_{23}/2$

1.3.2 not singularity

If the singularity is not present we can find theta and \mathbf{r} :

Note: we obtain two solutions for θ and cosequently \mathbf{r}

$$\cos(\theta) = (R_{11} + R_{22} + R_{33} - 1) \quad (5)$$

$$\sin(\theta) = \pm \sqrt{(R_{32} - R_{23})^2 + (R_{13} - R_{31})^2 + (R_{21} - R_{12})^2} \quad (6)$$

$$\theta = \text{atan2}(\sin \theta, \cos \theta) \in (-\pi, \pi] \quad (7)$$

$$\mathbf{r} = \frac{1}{2 \sin(\theta)} \begin{bmatrix} R_{32} - R_{23} \\ R_{13} - R_{31} \\ R_{21} - R_{12} \end{bmatrix} \quad (8)$$

2 Roll Pitch Yawn

2.1 RPY direct problem

To find \mathbf{R} from ψ , θ and ϕ we use the following formula:

$$R(\psi, \theta, \phi) = R_z(\phi)R_y(\theta)R_x(\psi) \quad (9)$$

Note: the order of the angle is reversed!

2.2 Inverse Problem

Given a rotation matrix \mathbf{R} we can find ψ , θ and ϕ : Fisrt check if there is a singularity (if $R_{32}^2 + R_{33}^2 = 0$).

2.2.1 singularity (hence $R_{32}^2 + R_{33}^2 = 0$)

If it is a singularity we can find $\phi + \psi$ and $\phi - \psi$:

$$\phi + \psi = \text{atan2}(-R_{23}, R_{13}) \text{ or} \quad (10)$$

$$\phi + \psi = \text{atan2}(-R_{12}, R_{22}) \quad (11)$$

$$\phi - \psi = \text{atan2}\left(R_{31}, \pm \sqrt{R_{32}^2 + R_{33}^2}\right) \quad (12)$$

2.2.2 not singularity

If it is not a singularity we can find ψ , θ and ϕ :

$$\theta = \text{atan2} \left(-R_{31}, \pm \sqrt{R_{32}^2 + R_{33}^2} \right) \quad (13)$$

$$\phi = \text{atan2} (R_{21} / \cos(\theta), R_{11} / \cos(\theta)) \quad (14)$$

$$\psi = \text{atan2} (R_{32} / \cos(\theta), R_{33} / \cos(\theta)) \quad (15)$$

3 DH frames

3.1 Assign axis

- z_i along the direction of joint $i+1$.
- x_i along the common normal between z_i and z_{i-1} .
- y_i completes the right-handed coordinate system.

3.2 DH table

- θ_i angle between x_{i-1} and x_i measured about z_{i-1} .
- d_i distance between x_{i-1} and x_i measured along z_{i-1} .
- a_i distance between z_{i-1} and z_i measured along x_i .
- α_i angle between z_{i-1} and z_i measured about x_i .

3.3 Transformation matrix from DH parameters

$${}^{i-1}A_i = \begin{bmatrix} \cos(\theta_i) & -\sin(\theta_i) \cos(\alpha_i) & \sin(\theta_i) \sin(\alpha_i) & a_i \cos(\theta_i) \\ \sin(\theta_i) & \cos(\theta_i) \cos(\alpha_i) & -\cos(\theta_i) \sin(\alpha_i) & a_i \sin(\theta_i) \\ 0 & \sin(\alpha_i) & \cos(\alpha_i) & d_i \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad (16)$$

3.4 DH parameters from transformation matrix

First we have to check that the first three by three submatrix is a rotation matrix (see section 1.1).

Then we can find the parameters:

$$\theta_i = \text{atan2}(R_{12}, R_{11}) \quad (17)$$

$$\alpha_i = \text{atan2}(R_{32}, R_{33}) \quad (18)$$

$$d_i = R_{34} \quad (19)$$

$$a_i = R_{14} \cos(\theta_i) + R_{24} \sin(\theta_i) \quad (20)$$

$$(21)$$

4 Workspace

4.1 2-DOF robot

The primary workspace is defined by two concentric circles of radius r_1 and r_2 where:

$$r_1 = |l_1 - l_2| \quad (22)$$

$$r_2 = l_1 + l_2 \quad (23)$$

4.2 3-DOF robot

The primary workspace is defined by two concentric spheres of radius r_{in} and r_{out} where:

$$r_{in} = l_{min} + l_{med} + l_{max} \quad (24)$$

$$r_{out} = \max(0, l_{max} - l_{med} - l_{min}) \quad (25)$$

where:

- l_{min} is the length of the shortest link
- l_{med} is the length of the medium link
- l_{max} is the length of the longest link
